

O is for orange. Orange trees are evergreens that can produce leaves, flowers and fruit all at the same time. They grow best in warm climates. Oranges do not ripen once removed from the tree. If ripe oranges are left on the trees too long they may turn from orange back to green in a process called re-greening. Oranges have been grown in the U.S. for about 125 years. Florida grows the most oranges, followed by California, Texas and Arizona. Brazil is the leading orange-producing country in the world. One orange contains all the vitamin C your body needs for the day!
